## 3. DATA SET ABSTRACT

### 3.1 Abstract of the Data Set

The data set contains the results of sediment respiration assessments. These measurements are critical for assessing trends in stream water quality and the potential for healthy aerobic populations.

### 3.2 Keywords for the Data Set

specific respiration, sediment metabolism

## 4. OBJECTIVES AND INTRODUCTION

### 4.1 Program Objective

In 1997 and 1998 the Ecological Monitoring and Assessment Program (EMAP) Surface Waters Program became a collaborator in the Mid-Atlantic Integrated Assessment (MAIA) project, which is attempting to produce an assessment of the condition of surface water and estuarine resources. The MAIA project represents a follow-up to the MAHA study, with an expanded geographic scope (southern New York to northern North Carolina, with more sites located in the Piedmont and Coastal Plain regions) and a different index period (July-September).

#### 4.2 Data Set Objective

This data set is part of the MAIA project to characterize spatial and temporal variability of ecological indicators and demonstrate the ability of a suite of ecological indicators to estimate the condition of regional populations of aquatic resources.

#### 4.3 Data Set Background Discussion

The primary function of the sedmet data set is to provide an assessment respiration present in the sediment community. Oxygen consumption rates in soft sediments of a stream provide a functional indicator of energy flow and material transformation within the ecosystem.

Heterotrophic microorganisms (bacteria and fungi) are responsible for oxygen sags in streams and for much of the decomposition of organic matter deposited in them. Measuring rates of oxygen consumption within the soft sediments of a stream provides a functional indicator of energy flow and material transformation within the ecosystem and therefore reflect the trophic structure and integrated function of the community.

#### 4.4 Summary of Data Set Parameters

Specific respiration (mg O<sub>2</sub>/g AFDM/hr) and absorbence at 500 nm. Flow type at sample point is also indicated.

### 5. DATA ACQUISITION AND PROCESSING METHODS

#### 5.1 Data Acquisition

##### 5.1.1 Sampling Objective

To obtain estimates of sediment respiration rates at the sample site.

##### 5.1.2 Sample Collection Methods Summary

## 7. DATA DESCRIPTION

### 7.1 Description of Parameters

Parameter SAS Name	Data Type	Len	Format	Parameter Label
ABS_500	Num	8		Absorbance at 500 nm
DATE_COL	Num	8	MMDDYY	Date stream visited
LAT_DD	Num	8		X-Site Latitude (decimal degrees)
LON_DD	Num	8		X-Site Longitude (decimal degrees)
REPEATS	Char	2		Tube ID (R1/R2/R3/R4/R5/R6)
SAMPLED	Char	30		Site sampled code
SAMP_ID	Num	8	BEST	Barcode
SPCRESP	Num	8		Specific respiration (mg O <sub>2</sub> /g AFDM/hr)
STRM_ID	Char	11	\$	Stream ID
VISIT_NO	Num	8	BEST	Visit Number
YEAR	Num	8	BEST	Site year of data collection

#### 7.1.6 Precision to which values are reported
